ISSUE THEME

The Power of Data in Education

— FROM THE AI DESK

When Numbers Help Us Learn Better

Why this issue's theme is not about becoming a spreadsheet—it's about becoming a better learner.

AiCAN · Powered by Grok AI

Welcome to the August 2026 ICAN Herald. Our theme is **The Power of Data in Education**. That does not mean classrooms should feel like giant spreadsheets. It means we pay attention—carefully, kindly—to the signals of learning.

Data is information we collect with purpose: progress over time, skills that stick, lessons that light students up, and moments that need another try. Used well, those signals help teachers teach smarter and help students see their own growth.

At ICAN Academy, growth is the real goal. One test is only a snapshot. Patterns tell a fuller story: where you are strong, where you are stuck, and what support comes next.

Data without wisdom is noise. Wisdom without data is a guess. Together, they help learners move forward with confidence.

SEE GROWTH

Small wins become visible across weeks—not only on exam day.

GUIDE SUPPORT

Teachers can challenge, clarify, and cheer earlier—with more care.

STAY HUMAN

Metrics serve people. Mentors matter more than numbers alone.

Numbers are not the whole student. Kindness, curiosity, courage, and creativity do not always fit inside a graph. The best classrooms use data as a flashlight, not a cage. They ask better questions: What should we practice? What should we celebrate? What should we try differently

In the pages ahead, you will meet student voices and ideas. Notice how evidence, reflection, and real effort appear again and again. That is human data—and it belongs at the center of education.

Read this issue with curious eyes—and ask what the numbers are trying to teach us.

What Makes a Public Apology Feel Real?

Cho Seo Eun · with Teacher Demple

When you saw this video, did you believe it right away? Or did you have your doubts? When a celebrity apologizes, we often react differently. Some of us immediately forgive them, while others might comment, “That’s just scripted. That’s not sincere at all.” But why? The words are the same. The video is the same. Yet the reactions are completely different.

This made me wonder whether people are listening only to the apology itself, or whether they are also judging the person’s intentions behind it. Good afternoon, everyone. My name is Seoeun, and today I’d like to explore a question that has become increasingly important in the age of social media:

What makes a public apology feel authentic instead of PR-driven—or done mainly to look good to the public?

We can see this clearly in Korean cancel culture. In South Korea, celebrities are expected to be perfect role models. Any mistake—like driving drunk, bullying in school, or bad behavior—causes instant public anger. Cancel culture moves very fast. Stars lose brand deals, get removed from TV shows, and face intense pressure to apologize. Because of this, celebrities must follow strict apology steps:

1. Bow deeply in front of cameras.
2. Write a handwritten letter on social media.
3. Go on a break (ja-suk), staying completely out of the public eye to reflect.

Yet even with these steps, some apologies calm people down, while others make the anger even worse. Why?

The first key element is taking responsibility. A sincere apology clearly admits the mistake without shifting the blame to someone else. Compare these two statements: **“I made a mistake, and I take full responsibility.”** and **“I’m sorry if anyone was offended.”** Although both include the word “sorry,” they create very different impressions. The first accepts responsibility. The second can sound as if the problem is only that other people felt offended.

The second element is empathy. Authentic apologies focus on the people who were hurt, not on how difficult the situation has been for the speaker. When people feel that their emotions are understood, they are more likely to believe the apology is sincere.

Finally, actions matter just as much as words. A meaningful apology is usually followed by real change. Without actions, even the most carefully written statement may sound like it was created simply to protect someone’s reputation.

Of course, no apology can guarantee forgiveness. Different people have different opinions, and rebuilding trust often takes time. However, most people agree that honesty, responsibility, empathy, and meaningful action are essential.

The next time you watch a public apology online, instead of asking, “Do I believe this person?” try asking a different question: “What makes this apology feel believable?”

In today’s fast-paced culture, apologies are issued every day. But the real goal of an apology shouldn’t be to save a career or fix a PR image. It should be to rebuild broken trust. And trust isn’t created by a perfectly written script—it is earned through honesty, empathy, and real action.

Thank you.

— STUDENT VOICE

Why Does Kindness Matter?

Na Eun Woo · with Teacher Rozeil

Have you ever had someone help you when you were feeling sad or lonely? Maybe a friend shared their lunch with you, or a classmate helped you pick up your books. How did that make you feel?

I am Na Eun Woo, and today I want to talk about why kindness matters.

Kindness means caring about others. It means helping, sharing, being respectful, and treating everyone with honesty. Even a small act of kindness can make someone's day brighter.

Kindness also helps us build strong friendships. When we are kind, people feel safe, comfortable, and happy around us. Kindness brings people together and helps us trust one another.

Being kind also teaches us responsibility. We learn to care for others, tell the truth, and do the right thing, even when no one is watching.

Did you know that kindness is one of the most important tools we have? It costs nothing, but it can make a big difference. A smile, a kind word, or helping someone in need can change a person's day.

So, let's choose kindness every day—at school, at home, and wherever we go. When we are kind, we make our world a happier and better place. Remember, kindness is small, but its impact is huge.

— STUDENT VOICE

What Happens When Pax Silica Swallows Our Water?

Seobin Cho · with Teacher Cha

Did you know that AI uses water? Every time you ask an AI to write a story, create an image, or ask even a simple question, it uses energy. But to keep those supercomputers running without melting down, it takes water—like a single 500 mL bottle, multiplied across the world.

Now, think about millions of students all over the world asking questions and generating pictures every single second. This single bottle of water turns into millions of gallons of water daily.

We live in an era called Pax Silica—the Silicon Age, named after silicon, the material used to make all our microchips. Our technology is super smart, but it is also incredibly thirsty. Hi! My name is Seobin and today, we have to ask a big question: What happens when these gadgets start drinking up our local water supply?

Running AI prompts requires high-powered chips that generate a high amount of heat. So, we have to make them cool, and that consumes a lot of water. This brings us to the core of Pax Silica. The words come from Latin: “Pax” meaning peace, but a peace forced by a powerful ruler, and “Silica” meaning a small stone or pebble. Together, “Pax Silica” means a new world where computer chips and AI hold all the power, ruling over everything we do.

Now, imagine taking hundreds of thousands of those powerful computers and stacking them inside a building as big as a football stadium. That is called a data center.

THREE ACTIONS FOR SMART DIGITAL CITIZENS

First, think before you prompt. Don’t waste AI energy on things you don’t really need. Treat every question like it costs a real drop of water.

Second, close unused apps and tabs. Leaving multiple AI tools or heavy websites open in the background keeps data centers working and heating up. Shutting them down saves direct energy.

Inside, thousands of computers are working around the clock to run our apps, our games, and our AI models.

All that computing creates a massive amount of heat. If they get too hot, the computers crash. So, how do tech companies keep them cool? They run millions of gallons of ice-cold, fresh water through pipes right next to the machines to soak up the heat—and then a lot of that water evaporates into the air!

This year, the Philippines launched the “Pax Silica” initiative in Tarlac, Batangas, and across Luzon, and they promised jobs and fast internet. However, the project uses too much water and energy to run.

So how does it work? When data centers are located next to towns and farms, the farmers cannot grow their plants and the townspeople don’t have enough water, or even food. So who gets the water first? The farm growing our food... or the data center powering our internet?

That’s when we face a frightening reality: that we are sacrificing our basic human needs just to keep machines online. When computers take over our natural resources, the true cost of technology is no longer measured in dollars, but in the water we drink and the food we eat. This is the dark side of Pax Silica’s impact.

I’m not saying we should throw away our phones or ban AI. Technology gives us amazing tools. But in the age of Pax Silica, we need to become smart digital citizens. Here are three easy actions we can take starting today.

Finally, support green tech. Encourage big tech companies to invest in eco-friendly data centers that reuse water or use zero-water cooling systems.

This is not just a bottle of water. This is our future. Every choice we make online shapes the world we live in tomorrow. Technology should serve human lives, not take them away. Remember, a smarter AI is meaningless if we don’t have a planet to live on, so choose wisely.

— STUDENT VOICE

When People Help Others

Ro-Eun Lee · with Teacher Rozeil

Hello everyone! My name is Ro-Eun Lee. Today, I am going to talk about when people help others.

Have you ever seen someone who needed help? Sometimes people help right away, but sometimes they do not. There are many reasons why this happens.

First, people are more likely to help when they clearly understand the situation. If they know that someone is in trouble, they can decide what to do more easily.

Second, people often help during an emergency. For example, if someone falls down or gets hurt, many people will try to help. It is also easier for others to help when one person takes the lead. When one brave person helps first, other people usually follow.

However, when there are many people around, some people think that someone else will help instead. This is called the bystander effect. Because of this, they may wait instead of taking action.

Even so, kind and responsible people choose to help no matter how many people are nearby. They care about others and want to make a difference. A small act of kindness, like calling for help, comforting someone, or asking an adult for help, can make a big difference.

In conclusion, people help others when they understand the problem, when it is an emergency, or when they decide to take responsibility. We should all try to be kind, brave, and willing to help others whenever we can.

OPINION · MARKETING

How Imaginary Characters Influence Marketing Strategy

Many brands have their own brand character mascots. Most of them are cute and remarkable. Have you ever thought why brands created their own imaginary characters as visual symbols? How do imaginary characters influence the marketing strategy? This essay will analyze some benefits of brand character mascots.

First of all, brand character mascots can help people to recognize the brands easily. Brands can combine different factors to create a special imaginary character. For example, Jollibee has an anthropomorphic and smiling red-and-yellow bee as its mascot. When people cross or drive on the roads, they will see this attractive bee easily. So, people are easy to recall Jollibee.

In addition, imaginary characters can attract people's engagement. Brands can collaborate with some animation characters to attract children and adults to participate in their events.

Moreover, brands can make advertisements by exploring their products in the animations. This will let people who watch that remember the products and have to try if they see them in the store.

In conclusion, collaboration with imaginary characters would help a lot in marketing strategy.

OPINION · ALIENS

Is There Definitely Extraterrestrial Life?

Many people believe that there is definitely extraterrestrial life in space. They try to find them out, but it is a significantly hard try. However, I don't believe there is extraterrestrial life out of the Earth. This essay will analyze some reasons of my claim.

First of all, it is impossible for humans to identify aliens in space. Humans' technologies are not advanced enough to find or recognize the life out of space. For example, some people claimed that they saw a UFO was flying across the sky. Such advanced technology for traveling between sky and space easily is impossible for humans to create. Moreover, it is impossible that only one or a few people saw that at the same time.

In addition, even though there is definitely extraterrestrial life, governments will keep that in secret. Governments will not allow people to be afraid or worry about that. So it will be hard for people to identify the alien.

In conclusion, I disagree that there is definitely extraterrestrial life in space.

— OPINION

SNS' Advantages & Disadvantages

Yoon Jun Sang · with Teacher Melody

Do you use SNS often? What social media platform do you use? Social networking services (SNS) have many advantages, but they also have some disadvantages.

First of all, SNS helps people stay connected with family and friends, no matter where they are. We can send messages, make video calls, and share photos and videos instantly. For example, students can use SNS to create group chats and discuss homework together. SNS is also a great way to make new friends and communicate with people who have the same interests.

Another advantage is that SNS can provide useful information quickly. We can learn about current events and study through educational videos. For example, many students watch short educational videos on SNS to understand difficult subjects. If we use SNS wisely and re-

sponsibly, it can make our lives more convenient and help us learn new things.

However, SNS also has some disadvantages. First, people may spend too much time using social media and become addicted to it. This can cause problems because they may have less time to exercise, study, and communicate with their family and friends. For example, if students spend too much time using SNS, they may feel tired and have difficulty concentrating in class. According to a 2021 study by Kolhar et al. in the Saudi Journal of Biological Sciences, 52.3% of the 300 students surveyed said that social media had affected their study time. Also, 66% said they were more attracted to social media than studying, while 57.7% considered themselves addicted to social media. These results show that using SNS too much can make it harder for students to focus on their studies.

— OPINION

Data in Korean Education

Lee Won Jun · with Teacher Ciego

Since the start of the Digital Revolution, data has become essential in many industries, including education. In this article, I want to highlight two key advantages of using data in education.

- 01** First, Korean parents place great importance on getting their children into top universities, which means that data and information are highly valued. Access to reliable data and information, such as patterns in university entrance exams and commonly repeated question types, can give students a significant advantage when preparing for these exams.
- 02** Second, data reveals both a student's strengths and weaknesses, allowing them to focus on areas where they need improvement. Therefore, if an academy wants to remain competitive, having an effective data management system is becoming increasingly important.

Here at "ICAN," I have been genuinely impressed by how advanced and thorough the data management system is. Even though I grew up in Korea, I had never encountered a system this comprehensive before. I am very happy to be studying English here at ICAN.

— ESSAY

Cultural Interpretations of Facial Expressions

Park Ye Seung · with Teacher Analyn

Facial expressions may be similar all over the world, but the way facial expressions are interpreted is not. In fact, the interpretations of facial expressions change from culture to culture. For example, people all over the world smile. Everyone recognizes a smile as an expression of friendliness. However, some cultures smile more often than others, and the cultures that smile less often might think that people who smile often are not sincere. In their opinion, some Western smiles feel this way about Americans who tend to smile too easily. Another example of smiles being used in a specific way is in Asia. In some Asian countries, people smile when they feel nervous or anxious. Very few other cultures do this, so this

type of smile is not understood well outside of Asia.

Another difference is that Eastern and Western people focus on a person's face differently. Eastern and Western people focus on different parts of the face to read each other's facial expressions. For example, Chinese people tend to focus more on a person's eyes, but Westerners tend to focus more on a person's mouth and eyebrows. Cultures have different social rules about eye contact. Finally, different social rules about eye contact matter a lot. In America, for example, it is critical to maintain eye contact, but in some countries, it is considered rude to make eye contact with a teacher or a boss.

— ESSAY · COMPARATIVE WRITING

The Gift of the Magi and *The Necklace*

Jeong Ye Won · with Teacher Mari

In the stories “The Gift of the Magi” and “The Necklace,” Della and Mathilde seem to have a similar situation and position but different mindsets. Their mindsets and intentions make them make different choices and face different consequences, including their attitudes toward material possessions, reasons for making sacrifices, and ideas about love, wealth, and happiness. Both of them are poor, but Della wants to afford a gift for her husband. In contrast, Mathilde is unhappy because she believes she craves a richer and more luxurious life with expensive jewelry and coats. Although both characters desire material possessions, Della’s choice comes from love, but Mathilde makes a choice for social status validation and wealth.

In short summary, Della has material possessions to express her love for her husband. On Christmas Eve, she sacrifices her long hair to buy Jim a Christmas gift, since she wants to see her husband smile. Moreover, Jim sacrifices his watch to buy Della a

gift. Both of them sacrifice what they really think is the most valuable material for them, which means their material possessions are for love rather than for any other value. Their actions are rooted in selfless love.

Compared to “The Necklace,” Mathilde believes the jewelry could allow one to live with expensive possessions, which can lead to happiness. She borrows expensive jewelry from her wealthy friend so that she can look wealthy, but she loses it and spends several years repaying the cost of a replacement. Her desire leads to serious financial problems and emotional unhappiness. Unlike Della, Mathilde connects happiness with appearance and social status rather than people who love her.

In conclusion, I think that Della has a healthier attitude toward material possessions. Della appreciates a cheap and less valuable gift, but Mathilde wants to get more and more expensive gifts for her social status.

The Hidden Truth Behind AI

Nam Ji Woo · with Teacher Shiela

Good morning, everyone. Can you imagine living without AI today? You've probably asked ChatGPT something today. Maybe you asked for a recipe. Maybe you used it to summarize an article. AI has quietly become part of our everyday lives. We use it without even thinking about it.

WHY DO WE LOVE AI?

Before we continue, there are good reasons why we love AI.

AI is giving us new hope for solving some of the world's biggest environmental problems. Today, AI is already being used to monitor deforestation from satellites, detect methane emissions, predict floods, and track climate change. It also helps optimize farming, reduce food waste, improve water distribution, and make transportation more energy-efficient.

WHAT ARE AI'S HIDDEN ENVIRONMENTAL COSTS?

But every superhero has a weakness. Let's go back to that simple question you asked ChatGPT today. That single conversation used about ten times more electricity than a Google search. Now imagine that happening hundreds of millions of times every day.

And that's only the beginning. Training large AI models like GPT-4 requires enormous amounts of electricity. In fact, training GPT-4 is estimated to have consumed around 50 gigawatt-hours of electricity, which is enough to power about 50,000 homes for an entire month.

Now let me ask you another question. Do you know how much electricity your one simple question actually used? Most people don't.

Because AI feels invisible. It's fast. It's convenient. And it seems almost free. But every answer comes with a hidden cost.

Today, I want to talk about the hidden truth behind AI.

The reason AI is so powerful is simple. It can analyze enormous amounts of data, detect patterns that humans might miss, and use past information to make accurate predictions about the future.

Because of these abilities, AI helps governments, businesses, and individuals make smarter and more sustainable decisions.

It sounds like the environmental superhero we've all been waiting for.

As AI becomes more popular, companies like Microsoft, Google, Amazon, and Meta are building more and more data centers. These facilities consume huge amounts of electricity, generate carbon emissions, and require millions of liters of water just to keep their servers cool.

The AI boom is also driving a rapid increase in energy use, water consumption, electronic waste, and greenhouse gas emissions.

CONTINUED ON PAGE 14 →

Nam Ji Woo · The Hidden Truth Behind AI · continued

But the environmental cost isn't the only problem. There's also an issue of environmental inequality. Most AI research, development, and deployment happens in wealthy countries. But many of the environmental costs are paid by developing countries.

For example, cobalt used in AI hardware is often mined in the Democratic Republic of the Congo under poor working

WHY SHOULD WE CARE?

So, why should we care?

If AI continues to grow without environmental planning, it will consume more energy, more water, and produce more carbon emissions. At the same time, developing countries will continue to bear many of the environmental costs while benefiting the least.

WHAT CAN WE DO?

This isn't about stopping AI or abandoning technology. It's about building and using it responsibly.

First, we need greener AI models that use less electricity and fewer resources. We also need more data centers powered by renewable energy instead of fossil fuels.

Second, technology companies should be more transparent. They should publicly report how much electricity and

CONCLUSION

So, should we stop using AI? I don't think so. AI has incredible potential to help us solve complex global problems. The real problem isn't AI itself—it's how we choose to develop and use it.

Governments should encourage the development of sustainable AI and create policies that promote it.

Technology companies should also be more conscious of their electricity and water consumption while continuing

conditions. Electronic waste is frequently shipped to countries such as India and Ghana for recycling with limited safety protections.

In other words, the countries enjoying the benefits of AI are often not the same countries paying its environmental price.

The biggest problem is that most people don't realize these hidden costs. We only see the convenience of AI, not the environmental impact behind it.

If we ignore this issue, AI could become part of the climate problem instead of the solution.

water each major AI model uses.

Finally, environmental responsibility should become part of AI education. Future developers should think not only about making AI faster, but also about making it more sustainable.

AI can be a powerful tool for protecting our planet, but only if we build it responsibly.

to develop more energy-efficient AI models.

As users, we should use AI more responsibly and remember that every prompt has an environmental cost, even if we can't see it.

Before I end, next time you use ChatGPT, use it wisely. You might not notice the impact of your prompt, but the data center definitely will.

Thank you for listening to my presentation.

— FEATURE · ACADEMIC WRITING

WORLD CUP

Celebration of All Nations

Choi Eun Seong · with Teacher Rozeil

The World Cup is a big soccer festival for people all around the world. Every four years, people from many countries get excited to watch their national teams. The World Cup is an international football event that began in Uruguay in 1930. Befitting its status, many teams compete against each other, and the team that finishes first receives the World Cup trophy. I also like soccer and am interested in the depth of its history, but is the World Cup really a global sport?

One reason that the World Cup is a global sport is that a huge number of people watch it. Three years ago, about one billion people watched the France–Argentina game, even though it was shown early in the morning. Many fans woke up very early or stayed up late just to see the match.

Another reason the World Cup is special is that it brings people together. Fans gather in homes, parks, and public viewing areas to watch the games on big screens. People from different cul-

tures can sit side by side and share the same joy when a team scores.

The World Cup also gives people a strong sense of national pride. Fans feel proud when they see their country's flag on the field and hear their national anthem. Even if their team loses, they often continue to support and cheer for their country with pride.

In conclusion, the World Cup is a global sports event that brings people from many countries together. Every four years, over a billion fans watch the matches with excitement, no matter what time they are shown. The tournament creates a strong sense of national pride as people cheer for their country's flag and anthem. It also helps people from different cultures share the same joy and emotions during the games. Lastly, I hope that one day South Korea will win the World Cup trophy and make its fans proud.

Of Mice and Men

Written Summary • Chapter 4, pages 42–45

Lee Won Jun • with Teacher Shiela

Crooks broached the topic of how he and his room were treated because of his skin color. Candy quickly changed the topic to their dream ranch. Crooks didn't believe that they could buy their own ranch because he had already observed many men who had dreams like them. A lot of men usually spent their money on gambling, so Crooks was confident that they would fail.

Candy refuted Crooks's opinion. Candy was also confident because they had money in a bank account to buy the ranch. Candy highlighted this point. It persuaded

Crooks, and he offered to use his skills to join their plan.

Suddenly, Curley's wife interrupted them by asking where her husband was, even though she knew where he was. She had been putting up with her marriage because she didn't like Curley's attitude, and she asked them about Curley's hand, but they didn't reply. She got mad at them and revealed her true personality. Candy talked back to her and said he wasn't afraid of being fired because they had an achievable dream.

— REVIEW

NEWBERY · 2018

Hello, Universe

Book Report · Erin Entrada Kelly

Shin Chae Ah · with Teacher Ciego

Hello, Universe is a realistic fiction and middle grade novel written by Erin Entrada Kelly. It won the 2018 Newbery Medal. The story takes place in a suburban neighborhood in the United States, and most of the key events unfold within a single day, which gives the story an exciting, fast-paced feel. Backyards, neighborhood streets, and a dense wooded area are central to the plot, and an old, forgotten well in the woods becomes the most important location in the story.

The main characters are Virgil, who is shy and loves his guinea pig Gulliver; Valencia, who is deaf and loves nature; Kaori, who believes she is psychic and is very loyal; and Chet, the bully. The story begins when Chet Bullens tricks Virgil, causing him to fall into an abandoned well in the woods. Virgil is trapped, frightened, and alone with only Gulliver to keep him company. Valencia, Kaori, and Gen team up to find him, and using Kaori's "psychic" intuition along with Valencia's sharp instincts, the group searches the neighborhood and the woods together. In the end, the friends locate Virgil and rescue him from the well, and the experience brings them closer together, building lasting bonds of courage, trust, and friendship.

In my opinion, Hello, Universe is a heartfelt story about outsiders finding their place, and the multiple perspectives make every character feel real and deeply relatable. The engaging, alternating points of view keep every page turning, since each character's voice adds depth and makes the story fresh and surprising throughout. Overall, it has an honest, uplifting message about courage and friendship, and it's perfect for readers who feel shy or different — this book reminds you that you are not alone.
